Extensions

Extensions offers a lot of flexibility to WooCommerce. As you have seen already, WooCommerce offers quite a lot of features and functionalities by default. These are really good when it comes to starting out with a store. You probably have only a few number of products and customers, which you can handle easily on a day-to-day basis. The scene will change quite soon when your store starts growing. Suddenly you will see a surge in traffic, customers and daily demands. Slowly, you will see the store management process growing to a level bigger than what you can handle by yourself. This is when you need to find extensions that will help to make your job easier.

Where to find extensions?

First of all, you can checkout the WordPress plugin repository. The advantage here will be that all the plugins listed will be free, and goes through a code review process that assures quality. Then you will find premium extensions on the [WooCommerce website](#), and several popular third party websites such as [CodeCanyon](#), [YITH](#), [XAdapter](#), etc. You will find quite a few resources when you start searching for extensions.

How to choose extensions?

Now, when you actually look for an extension for your store, you will see there are quite a lot of options. It takes a bit of an effort to identify a good extension. Let us look into some of the aspects that you need to consider before choosing a good extension for your store.

Compatibility

One of the primary aspects that you need to check before installing a plugin is whether it is compatible to the latest version of PHP, WordPress and WooCommerce. As WordPress and WooCommerce get regular updates, it is important to make sure the plugin you choose is stable with the latest version. On the WordPress plugin directory, you will see an option indicating up to which version of WordPress the plugin had been tested up to. In fact, you can ensure your site has the updated version of WordPress and then see if the plugin you are considering is stable with it. Similarly, you can check PHP as well as WooCommerce on your store, and make sure the plugin is compatible. In case of premium plugins, you can always raise a pre-sale query with the developer to ensure the compatibility of the plugin.

Description

INTRODUCTION

When you run an online store, a classic marketing strategy is to offer discounts to customers. It is important that you strategically create rules for the discount offers without affecting the profitability of your store. Setting a maximum discount amount for every applied rule is a simple solution to this predicament.

In addition, things get complicated when you have multiple categories of products listed on your store, and want to offer discounts based on multiple parameters.

Dynamic Pricing and Discounts for WooCommerce plugin offers well-defined solutions to help you set the best discount offers on your store.

FEATURES

- Product rules to set discounts on specific products.
- Category rules to set discounts on all products in a category.
- Option to set rules based on : Weight, Quantity, Price, Total Units and Number of items.
- Pricing table feature will appear on product page to show all offer applicable on that product, if a product has multiple product rules.
- Pricing table visibility (Hide/Show) in settings.
- Option to Set maximum discount to be allowed on every rule.
- Option to set rules expiry date (From Date , To Date).
- Option to set rules based on user roles.
- Multiple discount type available i.e (Flat Discount, Percentage Discount , Set a fix price for each unit).

Support

Issues resolved in last two months:

18 out of 21

You also need to ensure the plugin is compatible to your theme and other plugins you have already installed on your site. You can always find out in support forums if there are any known compatibility issues. However, if you notice a compatibility issue after installing the plugin you can always find out and contact the support team for a fix.

Updates

Another aspect you need to check before finalizing on a plugin is when was it last updated. A plugin that has not been updated for over two years is really not the most recommended option. So if you are comparing two similar plugins, and can't make a choice, the one that is updated recently would be a better choice.
